

Windows Basics (Learn to navigate windows, manage files, and use essential system tools).

Task 1 :- Introduction

You have used a computer or laptop then you've already met most familiar one: Microsoft Windows.

Now it's time to see real operating system behind the scenes manager that keeps your device running smoothly.

Scenario :-

In this room you'll take a role of new employee starting your first day at **tryhackme**. Once you login on your workstation, you'll get to know windows desktop, learn how to use windows, open tools from Start menu, and find your way through company folders. Your superior will guide you in creating and organizing files, changing system settings, checking Task Manager, and reviewing basic security settings.

Learning Objectives :-

- Navigate windows graphical interface, including desktop, taskbar and Start menu.
- Use File Explorer to browse folders, and understand file paths and organize files efficiently.
- Check System Settings and personalize windows Environment using Settings App.
- Use basic system tools like Task Manager and Windows Security to monitor performance and verify system protection.

Task 2 :- Exploring windows workspace :-

Before windows had its current polished look, Microsoft operating systems were much simpler.

Early computers ran MS DOS, which showed a black screen where you had to type commands instead of clicking icons. In 1985, Microsoft released windows 1.0 a basic graphical user interface (GUI) built on top of DOS, introducing windows, menus, and mouse controls to personal computers. Over time, windows had more features, which turned original shell into computer operating system. Today Modern window OS is result of those changes.

Logging in and Authentication :-

Before gaining access to windows Desktop, you must authenticate (prove your identity) to System.

The Authentication process verifies your identity and determines actions you're allowed to take once logged in. When user Account must be selected and authenticated with password, pin, or another verification method.

Each user is assigned a set of permission levels that determine files, Settings and System functionality.

Windows commonly uses the account types below: —

- * **Guest**: — A restricted account intended for temporary access, with minimal permissions and no ability to change system settings.
- * **Standard**: — A user account with every day tasks, running applications and change personal settings, without access to system-wide changes.
- * **Administrator**: — A privileged account with full control over System, including Software Installation, configuration changes, and user management.

Upon starting machine in previous task, you automatically logged in as Administrator account.

This will allow you to explore System Settings, install programs and perform administrative actions without being restricted by permission limit.

The windows Desktop: —

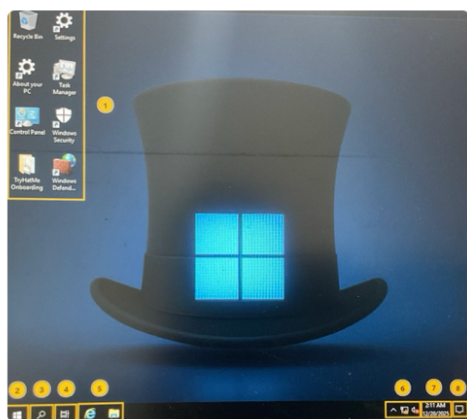

When you first log in you're presented with two main areas: —

- 1) **Desktop**: — The main workspace where files, folders and shortcuts live.
- 2) **Taskbar**: — A control strip that provides access to applications, system tools, Settings and notifications.

The image below is windows Server 2019. While newer windows versions may differ slightly, these core components and concepts remain consistent.

1. **Desktop icons**: — Shortcuts to items like Recycle Bin, folders, and frequently used Applications. It's fully customizable.
2. **Start menu**: — primary way to access Applications, Settings and power options. From here you can log out, restart or power off.
3. **Search**: — Quickly find Applications, files, folders and System Settings by using keywords.
4. **Task view**: — Allows you to see all currently open windows and quickly switch between them.
5. **Pinned Applications and Folders**: — you must used Applications and folders can be pinned here.
6. **Network and Audio Settings**: — This section can be customized to suit your needs.
7. **Date and Time**: — opens up to full Calendar. Date and time Settings can be accessed, here to.
8. **Notifications**: — Dismissal, immediate or application notifications. Network and other settings can also

be allowed.

Start Menu:—

When using Windows, the Start menu can be accessed by clicking the Windows icon located at the bottom left of the taskbar. It's an area where we see what is available: apps, files, folders, settings, and power options.

Built-in tools and Apps:—

Windows ships with many useful built-in tools and applications that you will see daily. Windows also includes simple but powerful tools such as Notepad for editing text files and File Explorer for navigating and managing files. These tools are available immediately and form the foundation of everyday Windows usage.

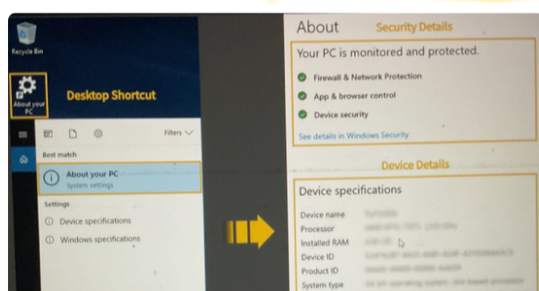

Ex:- Calculator, File Explorer, Notepad, Paint.

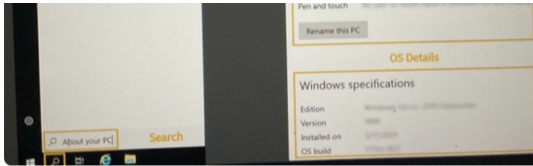

Getting System Information:—

Windows includes a built-in Settings application that allows you to configure and view information about your system. To get to know your new work PC better, we'll start by investigating the machine we're working with. With the Settings App, there's a helpful section called About your PC.

That provides key details about the system. A shortcut to About your PC has been created on the Desktop.

The About your PC section provides an overview of security, device, and OS information.

File Exploration and Management :- lets take a look on windows handle file exploration and management as we access some of onboarding documents for your new position. Before File Explorer, lets quickly cover how windows organize files and directories. Windows uses a hierarchical folder structure, meaning folder can contain other folders and files inside them. This structure helps keep data organized and makes it easier to locate information as systems grows larger. Common locations such as Desktop, Documents and Downloads serves as primary directories for storing files.

You seen VM and do.
