

Computer Types :- Explore different types of computers, from laptops to tiny chips inside your coffee machine).

Task 1 :- Introduction

Sophia was trying to connect new device to her home's wifi when she noticed something unexpected. "Nexus Cool Fridge X17". She laughed and wondered if connecting to Nexus Cool Fridge X17 would let her download cold meal. Setting joke aside, she soon realized her neighbor had brought some refrigerator, A fridge with built in computer capable of connecting to internet. It made her pause. Computers are not longer just laptops and phones. Everyday objects, from kitchen appliances to door bells.

Learning Objectives :-

After completion of this room, you will be able to identify and distinguish between different types of computers you use directly such as laptops and smartphones, and servers, IOT devices and Embedded Systems.

Sophia's Summer Internship lets go :-

Task 2 :- Sophia's Summer of Hidden Computers - Month 1

The computers you sit in front of

During first month at Nova Labs, Sophia learned an important lesson.

Sophia learned that

1. Not all computers are meant to move
2. Not all computers are meant of people to sit in front of.

She was introduced to 4 types of computers that often look similar but different purposes.

Computer Type	Screen and Keyboard	Main purpose
Laptop	Yes	Portable everyday computing.
Desktop	Yes	Fixed location.
Workstation	Yes	Precision and reliability for professional tasks
Server	No	Providing services to many users over a network

How Sophia learned difference :-

Sophia began with laptop, The computer she already knew best. It was perfect for emails & documents, but we pushed it to long tasks slow down. Grassiel explained laptops are built to be portable, staying cool in small battery device is difficult. Next she tried Desktop, It stayed in one place, used wall power, had better cooling. The same task seems smoother but much longer. Desktops are designed to consistency rather than mobility.

when Sophia moved to professional work, such as simulation and 3D models, Gabriel showed her workstation. It looked like desktop but built differently. Workstations prioritize accuracy and reliability. Finally Gabriel took her room full of machines with no screens at all. They were servers.

They run continuously, answering requests from multiple users.

Quiz:-

1) Which computer type usually runs without a dedicated screen and keyboard?

A) Server

2) What kind of computer with specialized components would one buy to carry out precision work?

A) Workstation.

Task 2:- Sophia's Summer of Hidden Computers

By her second month at Nova Labs, the most powerful computer most people own fits in their pocket, but million more hide inside everyday objects:- doors, lamps, coffee, machines.

Type	What it is	Examples
Smartphone	Pocket size, computer optimized for battery life and connectivity	iPhone, Android phone
Tablet	Touch first computers, with large screen	iPad, drawing tablet
IoT device	Network connected device with a single purpose	Thermometer, smart doorbell, fitness tracker
Embedded computer	Computer built into another device	coffee maker controller, automatic door sensor, lamp dimmer chip

IOT vs Embedded: — Both can be small and single purpose. The difference is connectivity.

IOT devices connect to network to report data or receive commands. Embedded computers might not connect anything.

Quiz:-

1) What is currently most popular pocket sized computer?

A) Smartphone

2) What kind of computer would you expect to find in coffee machine?

A) Embedded Computer.
