

6. Presentation layer: — layer 6 of OSI model in which standardisation starts to take place. Because software developers can develop any software such as email client differently, the data still needs to be handled in same way — no matter how software works.

* This layer acts as translator for data to and from application layer (layer 7). The receiving computer will also understand data sent to computer in one format destined for in another format.

Ex 1 — when you send an email, the other user may have another email client to you, but contents of email will still need to display the same.

* Security features such as data encryption (like HTTPS when visiting a secure site) occur at this layer.

Ques: —

What is name of this layer? presentation	2) what is the main purpose that this layer act as? A) Translator.
---	---

7. Application layer: —

The Application layer of OSI model is layer that you will be most familiar with. This familiarity is because application layer is layer in which protocols and rules are in place to determine how user should interact with data sent or received.

Everyday applications such as email clients, browser at the server browsing software or like zilla provider

a friendly graphical user interface (GUI) for users to interact with data sent or received. Other protocols include Domain Name System (DNS), in which is how websites addresses are translated into IP addresses.

Quiz:-

1) what is the name of this layer?

A) Application

2) what is technical term given to name of software that users interact with?

A) Graphical user interface
