

HTTP Methods (task 3): -

HTTP Methods are way for client to show their intended action when making an HTTP request. There are lot of HTTP methods but we'll cover the most common one.

Most you'll deal with GET and POST method.

GET Request

This is used for getting an information from web server.

POST Request

This is used for submitting data to web server and potentially creating new records.

PUT Request

This is used for submitting data to web server to update information.

DELETE Request

This is used for deleting information/records from web server.

Quiz:-

- 1) What method would be used to create a new user account? / 2) What method is used to update your email address?
- A) POST / A) PUT
- 3) What method would be used to remove a picture you've uploaded to your account? / 4) What would be used to view a news article?
- A) Delete / A) GET

Task 4:- HTTP Status Code:-

HTTP status codes:-

In previous task, you learnt that when a HTTP server responds, the first line always contains a status code informing client of outcome of their request and also potentially how to handle it. These status codes can be broken down into 5 different ranges:-

100-109-Information Response	These are sent to tell client first part of their request has been accepted and they should continue sending the rest of their request. These codes are no longer very common.
200-209 Success	This range of status of code is used to tell the client their request was successful.
300-399 Redirection	These are used to redirect client request to another resource. These can be either different webpage or different website altogether.
400-499 client errors	used to confirm client there was an error with their request
500-599 Server errors	This is reserved for errors happening on server side and usually indicate quite a major problem with server handling the request.

Common HTTP Status codes:-

200 - OK | The request was completed successfully

201 - Created	A resource has been created (for example a new user or new blog post)
301 - Moved permanently	This redirects client browser to new web page or tell search engine that the page has moved somewhere else and to look there instead.
302 - Found	Similar to above permanent redirect, but as the name suggests, this is only a temporary change and it may change again in near future.
400 - Bad Request	This tells browser that something was either wrong or missing in their request. This could sometimes be used if web server resource that is being requested expected a certain parameter that client didn't send.
401 - Not Authorized	You are not currently allowed to view this resource until you authorize with web application, most commonly with username and password.
403 - Forbidden	You do not have permission to view this resource whether you are logged in or not.
405 - Method Not Allowed	This resource does not allow this method request for example you sent a GET request to resource / create account when it was expecting a post request instead.
404 - Page Not Found	The page / resource you requested does not exist.
500 - Internal Service	The server has encountered some kind of error with your request that it doesn't know how to handle properly.
503 - Service Unavailable	This server cannot handle your request as it's either overloaded or down for maintenance.

Quiz :-

1) What response code might you receive if you've created a new user or blog post/article?

A) 201

2) What response code might you receive if you've tried to access page that doesn't exist?

A) 404

3) What response code might you receive if web server cannot access its database and application crashes?

A) 503

6) What response code might you receive if you try to edit your profile without logging in first?

A) 401
