

ports 101 (practical) :-

* Networking devices also use ports to enforce strict rules when communicating with one another.

* Any data sent or received by a device will be sent through these port. In computing, ports are numerical value between 0 and 65535 (65,535).

* Because ports runs between the range, there quickly runs risk of losing track of what application is using port.

* Any port that is within 0 and 1024 is known as common port. Let's explore some of other protocols below.

✂✂✂

Protocol	Port Number	Description
File Transfer Protocol (FTP)	21	This protocol is used by file sharing application built on client server model, meaning you can download file from central location.
Secure Shell (SSH)	22	This protocol is used to securely login system via text based interface for management
Hyper Text Transfer Protocol (HTTP)	80	This protocol powers the world wide web (WWW)! you browser use this to download image, videos of web pages
Hyper Text Transfer Protocol Secure (HTTPS)	443	This protocol does exact same as above, however secure using encryption
Server message Block (SMB)	445	This protocol is similar to FTP, SMB allows you to share devices like printers
Remote Desktop Protocol (RDP)	3389	This protocol is secure means of logging in to system using visual desktop interface

we have covered only more common protocols in cybersecurity.

Ex:-

IP :- 8.8.8.8 port 1224

... .. you ...

thm ; \$ nc 8.8.8.8 1234

Connection received: THM & you - connected - To - A. port?
