

Task 3:- Gathering System Information on windows

Now that you know how to move around and find files using windows command line.

Its time to learn how to ask the system questions about itself. Cybersecurity professionals do this all time. Before fixing a problem or investigating an incident, they first want to know.

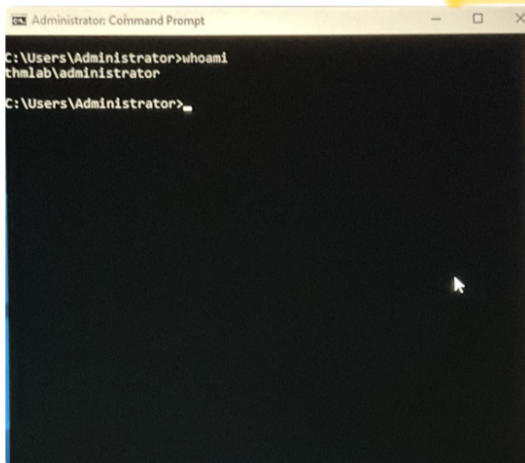

- * Who am I logged in as? | * What machine is this? | * What version of windows is it running?
- * How is it connected to network?

Step 1:- Who Am I logged in As?

When working on system, one of first things to check is which user account you're using.

This matters because different users can have different permissions.

Run the following command: `whoami`. This command prints the username of account you're currently logged in.

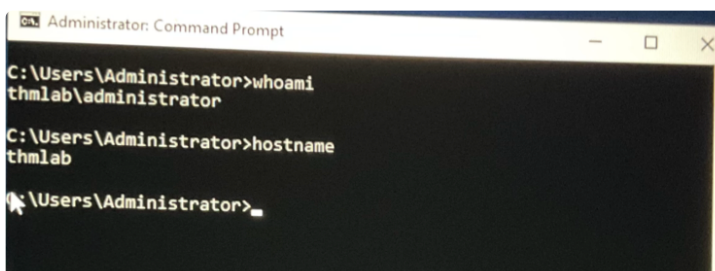

```
Administrator: Command Prompt
C:\Users\Administrator>whoami
thmlab\administrator
C:\Users\Administrator>
```

Step 2:- What is the Name of the Computer?

Every windows machine has a name. In workplace, this helps identify network systems.

To see computer's name, run: `hostname`

```
Administrator: Command Prompt
C:\Users\Administrator>whoami
thmlab\administrator
C:\Users\Administrator>hostname
thmlab
C:\Users\Administrator>
```

} thmlab

Step 3:- What version of windows is this?

Next, let's look at details about operating system itself. Run `SystemInfo`

This command prints lots of information. Don't worry, you're not expected to understand everything yet.

```
C:\Users\Administrator>systeminfo

Host Name:                THMLAB
OS Name:                  Microsoft Windows Server 2019 Datacenter
OS Version:               10.0.17763 N/A Build 17763
OS Manufacturer:         Microsoft Corporation
OS Configuration:        Standalone Server
OS Build Type:             Multiprocessor Free
Registered Owner:         EC2
Registered Organization:   Amazon.com
Product ID:               00430-00000-00000-AA750
Original Install Date:     3/17/2021, 2:59:06 PM
System Boot Time:         7/6/2026, 5:11:28 PM
System Manufacturer:      Amazon EC2
System Model:              t3a.medium
System Type:              x64-based PC
Processor(s):              1 Processor(s) Installed.
                           [01]: AMD64 Family 23 Model 1 Stepping 2 A
                           uthenticAMD ~2200 Mhz
BIOS Version:              Amazon EC2 1.0, 10/16/2017
Windows Directory:        C:\Windows
System Directory:          C:\Windows\system32
Boot Device:               \Device\HarddiskVolume1
```

Focus on these parts:-

* OS Name

* OS Version

* System Type

These details indicate version of windows the machine is running and whether its 32 bit or 64 bit.

Step 4:- How is this Machine connected to the Network?

Finally lets look at basic networking information: Run `ipconfig`

This Shows machine's network configuration.

look for:- * An IPV4 Address | * A Default Gateway.

```
C:\Users\Administrator>ipconfig

Windows IP Configuration

Ethernet adapter Ethernet 3:

   Connection-specific DNS Suffix  . : ap-south-1.compute.internal
   Link-local IPv6 Address . . . . . : fe80::556a:2092:e2e3:f5a%4
   IPv4 Address. . . . . : 10.49.129.10
   Subnet Mask . . . . . : 255.255.192.0
   Default Gateway . . . . . : 10.49.128.1

C:\Users\Administrator>
```

This helps you to understand how a machine connects to the network.

Summary:- In this task you learned how to ask windows system simple but important questions using command line

You practiced:- * Identifying who you are logged in as

* Finding name of the computer | * checking windows version and system details

* viewing basic network information
